Title : Data on the Problem of Overgrowing of Roughages with
Fungi (According to Experiments on Sheep)

Orig Pub : Albrecht-Thaer-Arch., 1957, 2, 69-86

Abstract : Six experiments were carried out on two wethers to determine the coefficients of digestibility of rations composed of roughages which were exposed, and of those which were not exposed to overgrowth with fungi. A mixture of rye, oat straw and phacelia hay were used as roughage. As a result of overgrowth with fungi, the nutritional value of straw and hay decreased, the losses of organic substances amounted to 5-7%, and a tendency towards better utilization of the digestible nitrogen of roughages overgrown with fungi became apparent. -- S.Ya. Kalmanson

Translation from: Referativnyy zhurnal, Mekhanika, 1958, Nr 11, p 238 (USSR)

AUTHOR: Lennov, V. G.

TITLE: Investigation of the Role of the Time Factor in the Strength of Pine Wood (Issledovaniye soprotivleniya drevesiny sosny s uchetom vliyaniya faktora vremeni)

PERIODICAL: V sb.: Issledovaniya prochnosti i deformativnosti drevesiny. Moscow, Gos. izd-vo lit. po str-uu i arkitekt., 1956, pp 93-106

ABSTRACT: The test specimens were loaded with specified load increments up to rupture. Following each loading step the load was maintained until the deformation of the aftereffect (primary creep; Transl. Ed. Note) had come to a standstill. On additional specimens the stress-strain relationships were determined through the usual short-term machine tests. On the basis of the material obtained the author denotes two ranges of the state of stress in wood, namely, a first (lower) one up to that stress which corresponds to the inception of plastic flow in the wood, and a second (upper) one above that stress limit. The first range, in the author's opinion, should also serve as a basis for the construction of a theory of stress analysis for wooden construction

Card 1/2

Investigation of the Role of the Time Factor in the Strength of Pine Wood

elements relative to both strength and stiffness, the development of which is given by him in the work reviewed. Reduced limit diagrams are adduced for the compression and tension of pine wood. These diagrams illustrate the general relationship between the relative stresses and relative strains of pine wood along the fibers with consideration of the time factor; the limits of the stress-rupture time properties of pine wood (i. e., the strength limits with consideration of the time factor), including compression $\sigma_{s-r/compr} = 0.62 \sigma_{compr}$ and tension $\sigma_{s-r/tens} = 0.8 \sigma_{tens}$, where σ_{compr} and σ_{tens} are the strength values for the wood obtained by the standard machine tests; also special and generalized diagrams of the aftereffect strain during compression and tension of pine wood along the fibers.

A review of opinions on the effect of ACTH and cortisone published in recent years and the evaluation of personal results in 21 cases, 15 of rheumatoid arthritis 5 of ankylosing spondylitis and one of hydrarthrosis of both knees. The results of these cases were markedly less favourable than those published elsewhere after the same treatment. In ankylosing spondylitis improvement occurred in one patient only. Side-effects of the hormone therapy were not frequent because the authors strictly observed all contra-indications and because the patients were under clinical and laboratory supervision. In one patient marked deterioration during treatment with ACTH occurred.

The first day 15 g. salicyl in doses of 1 g. every hour is given. If the ESR shows a considerable fall, the quantity of salicyl is reduced gradually to 9 g. daily in the course of some days. This dosage is maintained until the ESR - determined every 5 days - has remained three times below 10 mm. (after one hr.). The dosage is then reduced by 1 g. per week during the course of the next 4 weeks. The treatment is not stopped until 3 months after the disappearance of the last signs and symptoms. Streptococcal infections should be avoided afterwards. If hormonal treatment is applied the patient should carry a note on him on which this is stated, as he has a decreased resistance against stress situations; in severe infections, trauma or acute surgical procedures cortisone should be given until 3 months after the end of treatment.

THE OCCURRENCE OF TYPICAL LE AND SIMILAR CELLS IN ACTIVE RHEUMATOID POLYARTHRITIS - Výskyt typických buněk le a buněk jin podobných u aktivní progresivní polyarthritidy - Lenoch F., Vojtíšek O., Kocian I., Matějček V. and Mařášková L. Výzkumný list, Chorob Reumatických, Praha - FYSIAT. VESTN. (Praha) 1957, 35/5 (260-272)

Tables 7 Illus. 1

Systemic lupus erythematosus occurs less frequently in Czechoslovakia than in Western countries. This could be explained by the fact that antibiotics and chemotherapeutic drugs are used less abundantly in Czechoslovakia than in some other countries. Among 120 patients suffering from progressive polyarthritis LE cells were revealed in 3 patients (one man), and A and B cells, described by Heller and Zimmermann, resembling LE cells in a further 23 patients. In 26 patients (i.e. 17.3%) LE cells or cells resembling them were found. This figure corresponds to that of Goslings et al. (17% and 15%) though rosettes were not considered as positive findings. Because like Goslings' all cases were evaluated without specially selecting them, figures as high as Freyberg's could not be obtained because he selected only atypical cases or complicated cases. Typical LE cells, however, were detected only in 2% of all cases investigated. (VI, 13, 19)

TITLE: Development of new polymeric compositions for making plastic dies

SOURCE: Moscow. Eksperimental'nyye nauchno-issledovatel'skiy Institut kuznechno-pressovogo mashinostroyeniya. Nauchnye trudy, no. 8, 1964. Novoye v kuznechno-shtampovochnom proizvodstve (Latest developments in the forging industry), 136-143

TOPIC TAGS: die material, plastic die, furfural acetone polymer, metal stamping

ABSTRACT: The paper begins with a brief discussion of the advantages of using plastic dies in small-lot and to some extent in medium-lot production. The results of an investigation into new plastics for die fabrication, using cheap and easily obtainable polymeric materials which would have physico-mechanical properties suitable for pressworking, are then reported. Finally, a new material, furfural acetone monomer of the FA brand, which was recently put into production in a number of plants, is described. The FA monomer is a product of the condensation of furfural and acetone in the presence of alkaline catalysts. It polymerizes in the presence of ionic catalysts, particularly aromatic sulfonic acids (the most effective catalyst was found to be benzenesulfonic acid), changing into a hard,

Card 1/2

L 15160-65

ACCESSION NR: AT4048355

infusible and insoluble substance; its cost is about 25 cents per pound. It is used as a binder material, silica sand being used as a filler. Three compositions were developed for the manufacture of dies for pressworking which differed only by different ratios of the binder (the FA monomer) and the hardener (benzenesulfonic acid); a composition was also developed for the manufacture of the cores of the working parts of dies which have to be strengthened for compression and static bending. The procedure for producing die cores using the above compositions is briefly described. Tests have shown that such dies, with a 5-20 mm thick layer of composition, can be used for cold pressing of parts from nonferrous and ferrous metal sheets 2 mm in thickness. Such dies satisfy the requirements which have to be met by plastic dies for use in pressworking and are only one third as expensive as dies made of compositions based on epoxy resin. Orig. art. has: 5 figures and 3 tables.

Volkhova.

PURPOSE: This collection of articles is intended for persons specializing in computer technique.

COVERAGE: Most of the work in this first issue of the Collection of Articles of the Institute of Electronic Control Machines of the Academy of Sciences, USSR, was carried out during 1958-1959, and was dedicated to digital technique. The Institute conducted studies aimed at creating a high-speed memory device of large capacity. One of the results of this work was improvement of the K2 computer by replacing its static storage device with ferrite cores. Other articles concern the use of transistors in direct coupled amplifiers, and the use of the M-2 computer with operational amplifiers. Future issues of this collection of articles will present the results of work in digital techniques in solving various problems. Future issues of this collection of articles will present the results of work in control machines and in mathematical investigations, and in control systems and techniques of control, which operate on the principle of digital systems. Some personalities are mentioned in the articles.

References accompany some of the articles.

Dorofeeva, N. A., and A. B. Zalkind. Use of Surface-Barrier Transistors in Circuits with Direct Coupling. 37

A small lot of the first Soviet-made surface-barrier transistors was tested at the Laboratory of Control Machines and Systems, in separate circuit elements with direct coupling. The authors give an account of the operating principle and methods of the simplest analysis of performance of such circuits. They present the principal result of their experiments and conclude that such circuits require less power and are much simpler in production than those equipped with ordinary transistors. There are 3 references: 2 English and 1 Soviet.

Zalkind, A. B., and L. Ya. Chusakov. Transistorized Digital Frequency Meter. 36

A frequency meter using a generator of standard frequency with quartz stabilization was developed at the Laboratory of Control Machines and Systems. This meter was used for measuring acc. 50-cps network frequency with errors not exceeding 40 cps within a range of 50-1,5 cps. This frequency meter is equipped with PNP transistors and its power consumption is about 350 mW. It was found that the application of digital technique paralleled attainment of a high degree of stability.

Mashtsov, O. V. Study of the Technological Spread of Parameters in Transistors. 74

The measurements of parametric spread made by the author demonstrate that the spread occurs independently of each individual parameter. The results of measurements were processed statistically. There are five references, all Soviet (one of them is a translation).

Mazantov, O. V. Instability of Transistor Characteristics and Parameters. 87

The author presents the results of experimental testing of the parameters and characteristics of P_N, P_G, P_S, and P_H-type transistors.

ICHEN, V. V. Stability of Electronic Simulation Circuits Equipped with D-C Amplifiers. 84

The author discusses ways of obtaining stable simulation circuits for solving problems by analog computers equipped with operational d-c amplifiers with strong feedback. Such circuits are widely used for simulating dynamics of automatic control systems. The author studies stability of additional circuits used for the solution of problems described by differential or integral differential equations. These problems are solved with the time-delay units of the analog computer, on which the problem variables have been introduced in the form of transient components in the circuit. Problems in which the independent variable does not appear are solved in the intervalless units. The author analyzes some typical equations presents their block diagrams, and finds conditions for stability. There are seven references: 6 Soviet (one of which is a translation) and 1 English.

TITLE: Device for communicating with controlled objects. Class 42,
No. 170766

SOURCE: Byulleten' izobreteni i tovarnykh znakov, no. 9, 1965, 95

TOPIC TAGS: digital computer, ^{b6}component interrogation element, com-
mand element, storage matrix, matrix

ABSTRACT: The proposed device is intended for transmission of command
and interrogation signals by digital control computers. The memory-
cell matrix design includes a double system of buses for selecting two
(switching and interrogation) storage cores of any cell through direct
and inverse addresses. The switching core is coupled through a shaper
to the controlled object. The shaper is in turn connected to a release
circuit servicing the entire matrix. The interrogation core is con-
nected to the controlled object.

nected to the remaining two cores of the cell, which store information
on the condition of the objects. The output windings of the latter
cores are connected to two reading amplifiers common to the matrix.

TITLE: A coupler from a digital computer to controlled plants

SOURCE: Avtomatika i telemekhanika, no. 2, 1966, 82-92

TOPIC TAGS: digital computer, computer control system, control system equipment, coupling circuit

ABSTRACT: The main function of a coupler of a control computer is to distribute and issue the control commands of the "switch" type ("switch on," "switch off") to controlled plants according to the address selected by the control computer. The coupler must also receive information on the state of each controlled plant (switched on or off). The present article describes a coupler for which the present authors obtained a patent (Ustroystvo svyazi s upravlyayemymi ob'yektami. Avtorskoye svidetel'stvo No. 170766 s prioritetom ot 13.IX.1963. Byull. izobret., no. 9, 1965). The coupler assures reliability in the control of the plant by means of the control computer, prevents the possibility of issuing

Card 1/2

UDC: 681.142.35

L 21980-66

ACC NR: AP6007865

erroneous control signals to the plants due to malfunctions and defects in the coupler or in the computer itself. The coupler does not relay its command immediately, but stores the information in a corresponding cell of its matrix. A second command to the coupler, which is given according to another (inverse) address of its matrix, produces a command to the plant only if both commands were correct. The diagrams and characteristics of some of the versions of the coupler are presented. Orig. art. has: 7 figures and 1 table.

TITLE: The kinetic energy distribution of the geostrophic wind in the northern hemisphere at sea level and at the 500 mb isobaric surface

SOURCE: Moscow. Nauchno-issledovatel'skiy institut aeroklimatologii. Trudy, no. 28, 1964. Voprosy aeroklimatografii severnogo polushariya (Problems in the aeroclimatology of the Northern Hemisphere), 96-111

TOPIC TAGS: geostrophic wind, wind energy, baric field, isobaric surface, cyclone, anticyclone

ABSTRACT: A computerized method of calculating the kinetic energy of the geostrophic wind is described. An analysis is made of the distribution of the kinetic energy of the geostrophic wind at ground level and at the 500 millibar isobaric surface for the northern hemisphere. For purposes of analysis the northern hemisphere is divided into a number of squares, all equal in area to a 10-degree square at the equator. Daily data for the months of January, April, July and October in the period 1954 through 1958 were assembled and prepared in punched card form at the Otdel sinopticheskoy klimatologii (Department of synoptic climatology) of NIIZK by

Card 1/3

L 33141-65

ACCESSION NR: AT5001800

Ye. N. Abramova, R. P. Kornilova, Ye. M. Smirnova, and N. P. Tvoremirova. The method used in preparing the data was previously described by A. P. Barabashkina ('Povtoryayemost' baricheskikh obrazovaniy v tsentral'nye mesyatsy sezonov za 1954-1958 gg. v severnom polusharii (severnee 20--30° s. sh.), Trudy NIIAK, No. 19, 1962). An expression is derived for the kinetic energy of the geostrophic wind in joules per kilogram with the tabulated daily density of isobars and the average monthly air density for each square as experimentally obtained variables. An analogous expression is obtained for the geostrophic wind energy on the 500 millibar isobaric surface with the number of contour lines crossing each side of the square as the variable. The calculated energy distribution is shown graphically for each instance (see Fig. 1 of the Enclosure). Maxima generally appear in the northern sections of the Atlantic and Pacific oceans. Comparison of the average kinetic energy distribution with the incidence of cyclonic and anticyclonic centers shows that there is some correlation between maxima of the kinetic energy and the incidence of cyclonic centers. Maxima usually occurred to the south-west of centers of increased cyclonic activity. Orig. art. has: 14 formulas, 6 figures and 6 tables.

TITLE: Semiconductor amplifier with high input resistance for piezoelectric converters

SOURCE: AN UkrSSR. Voprosy prikladnoy akustiki i vibratsionnoy tekhniki (Principles of applied acoustics and vibration technology), Kiev, Naukova dumka, 1966, 109-111

TOPIC TAGS: audio amplifier, piezoelectric transducer, acoustic radiation, transistorized amplifier

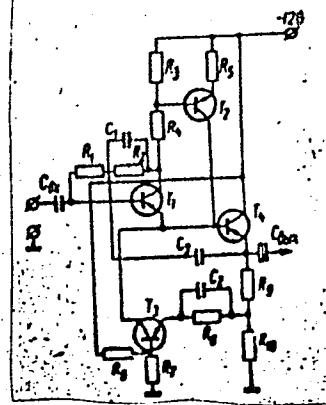

ABSTRACT: The author describes a transistor amplifier (Fig. 1) developed specially to work with acoustic converters, with an input resistance 10 - 15 megohms in the frequency range 20 cps - 20 kcs and an output resistance of 20 ohm. The input signal ranges from 50 μ v to 100 mv. The amplifier is based on an emitter-follower circuit using both positive and negative feedback. The use of a dc source in the emitter circuit of the first transistor makes it possible to optimize the amplifier operation and to effect regenerated positive feedback and obtain a large feedback coefficient. This makes the overall gain of the circuit equal to several thousand, and the voltage transfer coefficient close to unity. Equations for the input resistance, based on the equivalent circuit, are presented and the plot of the frequency dependence of the input resistance is given. The types of transistors and the circuit elements employed

TITLE: Reliability of controlled mercury rectifiers used in electronic drives of rolling mills

SOURCE: Elektrotehnika, no. 9, 1966, 7-10

TOPIC TAGS: reliability, mercury rectifier, rolling mill

ABSTRACT: Records of total failures of RMV-250/2 Soviet-made sealed-off mercury rectifiers, which supplied power to two reversing mills, are used as initial statistical material. From these records, histograms of the mean frequency of failures, failure rate, and reliability data are plotted. This data indicates that the total failures of the above rectifiers obey an exponential law;

Card 1/2

UDC: 621.314.652.001.2

ACC NR: AP6031520

they can be characterized by the mean time to first failure. Both theoretical and experimental (9-stand continuous rolling mill) values of the mean time to first failure, for the above rectifiers, are equal to 16 months; this time is the factual life of the rectifier. Operating experience with RMV-250/2 rectifiers has shown that their failures are due to "nonobservance of proper manufacturing processes, low quality of source materials, lack of records of operating conditions, inadequate manufacturer's quality control, absence of reliable high-speed protection, and imperfection of design." The immediate causes of rectifier breakdowns are detailed. The mean frequency of arcbacks in EVNU-500 and RMNV-1000 rectifiers is 42 and 18 per 6 per year, respectively. Orig. art. has 3 figures, 12 formulas, and 1 table.

Clarification of apple wines. A. S. Lentshin (Pedagog. Inst., Abakan). *Vinodelia i Vinogradarstvo SSSR* 13, No. 9, 10-21(1953). An apple wine, contg. alc. 17 vol.-% sugar 0.9%, titratable acidity 0.6, volatile acids 0.8, and the wine colloids 2.5 g./l., resp., was treated by varying amounts of agar-agar (I), gelatin (II), egg albumin (III), and of light (IV) and dark (V) blood albumins with the following results: I had no clarifying effect; the other additives clarified the wine within 6-10 days when given in the following amounts: II 0.15-0.4, III 0.15-0.4, IV 0.1-1, and V 0.1-1 g./l., resp. The amt. of each coagulator added was directly related to the amt. of the colloids present in the wine. Addn. of 0.05 and 0.1 g. of tannin/l. before treatment had no effect. The best clarifiers were IV and V. To prep. these clarifiers dissolve 10 or 15 g. of either IV or V in 1 l. water (dm₃) of the solids, 1.0201 and 1.0384, resp., filter the solns. obtained, dil. them with the wine to be clarified in the ratio 1/10, and add the mixt. into the wine reservoir; after 5-6 days the product is ready for decantation and filtration. Both IV and V are equally effective clarifiers. However, in the case of white wines, large quantities of V (0.7-1 g./l.) effect the color of the end products.

TITLE: Experiments on the application of PbI₂ in water solution to supercooled clouds

SOURCE: Leningrad. Glavnaya geofizicheskaya observatoriya. Trudy. no. 126, 1962. Voprosy fiziki oblakov i aktivnykh vozdstvii, 16-21

TEXT: Clouds or mists are treated with a combustible water solution of PbI₂ sprayed out of an air-plane at a pressure of 3-4 atmosphere through sprayers comprising 32 nozzles 1.2 mm in diameter. The effect has been observed from an altitude of 0.5-1.0 km over the upper cloud limit. In cumulus clouds with a vertical capacity of 2 km and over, precipitations have been obtained below -7°C. Compact strato-cumulus clouds with a capacity of 200-460 m were dissipated below -15°C. At ~ -29°C, both the PbI₂ solution and the water itself produce cloud dissipation. There is 1 table.

TITLE: Mapping of maximum vertical velocities in clouds in its application to forecasting convection levels

SOURCE: Leningrad. Glavnaya geofizicheskaya observatoriya. Trudy, no. 176, 1965. Voprosy fiziki oblakov i aktivnykh vozdeystviy (Problems in cloud physics and active modification), 60-68

TOPIC TAGS: weather forecasting, cloud, air mass, frontal zone

ABSTRACT: The analysis of vertical velocities by layers in the atmosphere is considered as a means of determining conditions of clouds and of predicting future conditions. Changes in kinetic energy of a unit mass of air in a cloud as the air rises through a series of layers from base to top of the convective zone may be expressed by

$$\Delta \left(\frac{v^2}{2} \right) = \frac{\sigma}{6} \frac{\Delta H}{T_0} \sum_{k=1}^{n-1} [(T_k - T) - S_0(T_k - T_0)]$$

where σ is gravitational acceleration, T_0 is air temperature at base of cloud, T

Card 1/3

L 63025-65

ACCESSION NR: AT5016807

the air temperature at upper boundary of the kth layer, T_B and T_C the temperature acquired by the air as it rises to the upper boundary of the layer (for wet and dry adiabatic stages respectively), v is the vertical velocity of the stream in the cloud at a height ΔH above the base, ΔH is the thickness of the kth layer, and S_0 represents the number of clouds of the given thickness. For a single cloud mass the expression is greatly simplified to

$$\Delta \left(\frac{v^2}{2} \right) = \frac{1.635 \Delta H}{T_0} \sum_{k=1}^{n'} (T_B - T_k)$$

Radiosonde data were used to construct graphs for maximum velocities during nighttime and daytime hours. These graphs were made for different situations: for weather entirely within a single air mass, for weather at a cold, closed front, and for intermediate conditions. It was found that computations from nighttime data agree with actual daytime values only in restricted situations. Differences between predicted values of maximum velocity within a mass and in the frontal zone are greatest at low values of maximum velocity and become vanishingly small at large values. Corrections may be made by using the graphs and may thus improve the predictability. It is concluded that the best prediction of possible maximum velocities of convective movements above any actual region may be made by using

nighttime radiosonde data (3:00 a.m.) and a predicted daytime maximum temperature to compute maximum velocity at a level where $\sum_{k=1}^n (T_B - T)$ is a maximum, and then to resolve what synoptic position is expected in this region for the period of maximum convection during the day (generally 1:00 to 5:00 p.m.). The proper value is then selected from the above-indicated graph, corresponding to the computed value. Orig. art. has: 2 figures and 3 formulas.

Ion exchange on cellulose and its derivatives. V. I. Ivanov and N. Ya. Leshina (N. D. Zelinskii Inst. Org. Chem., Moscow). Tr. Akad. Nauk S.S.R., Otdel. Khim. Nauk 1956, 508-7. Passage of Fe⁺⁺⁺ or Ni⁺⁺ ions through columns packed with cotton cellulose or oxidized cellulose contg. 50-280 meq. CO₃H/100 g. was studied. The results indicate ion-exchange properties due to the CO₃H groups present in the cellulose. However, Ni ions are absorbed from a neutral soln. strictly in accord with the CO₃H groups present, but the uptake of Fe⁺⁺⁺ ions was about 60 meq./100 g. regardless of the nature of the cellulose. Hence the Fe⁺⁺⁺ requires a different mechanism of adsorption from that of the Ni⁺⁺. G. M. Kosolapoff

No. 1, pp. 118-119 (U.S.S.R.)

ABSTRACT:

A study of interchange reaction of hydroxy cellulose showed that the sorption of Ni and Fe cations by cellulose oxidized with sodium periodate and sodium chlorite is equivalent to the amount of the carboxyl groups. The carboxyl groups in the hydroxy cellulose, prepared with certain changes, were determined by two different methods. It was found that the dynamic interchangeability of hydroxycellulose, in the case of nickel acetate, is 0.5 and 0.7 of the total interchangeability. The equivalent absorption of Ni^{++} and Fe^{+++} by oxidized cellulose indicates that inorganic

✓ separation of some cations from trivalent iron on oxy-cellulose. V. I. Ivanov, N. Ya. Lenshina, and V. S. Ivanova (N. D. Zelinskii Inst. Org. Chem., Moscow). Izvest. Akad. Nauk S.S.R., Otdel. Khim. Nauk 1957, 518-16. Quant. sepa. of Ni, Co, Cu, Zn, Pb, Sr, Mg, Ca, Ba, and Al from Fe(III) was attained on oxycellulose by the previously described method (C.A. 50, 12467g). The oxy-cellulose sample (12.2% CO₂H, 2.7 mg. meq./g. capacity) was selected so as to completely take up the Fe⁺⁺⁺, and the filtrates were analyzed for the other ions colorimetrically. Traces of these ions remaining on the oxycellulose can be safely eluted with 0.01N HCl. Fe(III) is totally absorbed at pH 2; Cu(II) at 5, and Ni at 6. G. M. Kosolapoff

TITLE: On the Characteristic Features of the Oxidation of Cellulose by Sodium Periodate and Sodium Chlorite (Ob osobennostyakh okisleniya tsellyulozy peryodatom natriya i khloritom natriya)

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye khimicheskikh nauk, 1958, Nr 6, pp. 775 - 777 (USSR)

ABSTRACT: On the basis of the works by Jackson (Dzhekson) and Hudson (Gudson)(Refs 1,2,3-9) the authors investigated the properties of the preparations (formulae I and II) and found that the said preparations separate CO₂ (under the conditions of decarboxylation). On the strength of results obtained already earlier (and of spectroscopic data) (Refs 10,11) the authors assumed that partial oxidation extends over the 6-carbon atom (Ref 12). Thus, sodium periodate oxidizes not only the α -glycol grouping but also the hydroxyls of cellulose in position (6) up to the aldehyde-and carboxyl groups. There are 4 figures, 3 tables, and 15 references, 4 of which are Soviet.
